

PDF to PNG converter

This is a simple bash script which convert a single pdf document to a single png file. So whats the secret? This script supports multipage PDF documents and convert them to a **single png file**.

This script is for you if you have multipage or singlepage pdf documents and need to batch convert them to png. You can run on a full folder with pdf files and convert them all with a single command.

It's written and tested on a mac but should be compatible for linux, too

Requiements

1. pdftk - [Download v2.02 - osx](#)
2. imagemagick convert - [download](#)

Why such requiements?

1. pdftk split the pdf file
2. imagemagick convert it to png combine it back and crop existing whitespace

How to use?

1. Put that .sh in a folder with some pdf files.
2. Run `chmod +x pdfToSinglePng.sh`
3. run `./pdfToSinglePng.sh`

.png files will be created beside .pdf files with the same filename each pdf page goes vertically upon the other with a spacing between each page.

Any plans?

It would be really cool if anyone can add parameters to this script.
Maybe you have other ideas, making an alfred workflow ?
